Walter Jehne explaining atmospheric humid haze <https://northlandclimatechange.org/humid-hazes/>

Biological weed control:

The assertion is that early successional weeds are adapted to compete for nitrate in the soil, but mid and late successional plants (like many perennial grassland plants) are adapted to compete for ammonium. Therefore, if we get a healthy soil food web reestablished, the microbes are capturing nitrates and the predator organisms are releasing nitrogen as ammonium.

Nakatani, K., & Fujii, Y. (2013). Influence of the nitrogen form on in vitro organogenesis in *Equisetum arvense*. *Weed Biology and Management*, 13(4), 151-155.

Link: <https://onlinelibrary.wiley.com/doi/full/10.1111/wbm.12023>

BOHLMAN, M. J. RELATIVE STABILITY OF NITROGEN IN SOIL ORGANIC MATTER DEPENDS ON SOURCES OF INPUT.

https://www.caryinstitute.org/sites/default/files/public/reprints/bohlman_2017_reu.pdf

(Not directly related to weeds, but it does explain that ammonium is a long-term N source whereas nitrate leaches out quickly)

Ingham, E. R., Cambardella, C., & Coleman, D. C. (1986). Manipulation of bacteria, fungi and protozoa by biocides in lodgepole pine forest soil microcosms: effects on organism interactions and nitrogen mineralization. *Canadian Journal of Soil Science*, 66(2), 261-272.
